-1- FUNCTION: May be a transcriptional repressor that represses both basal and activated transcription.

-1- SUBUNIT: Homodimerize.

-1- SUBCELLULAR LOCATION: Nuclear (By similarity).

-1- TISSUE SPECIFICITY: Highly expressed in subregions of the brain, moderately expressed in skeletal muscle, heart. Weakly expressed
                                                                                                                                                                                                              regulation.

L. SHBLORI SECONTION: Uctor as a transcriptional factor for neuron differentiation.

C. -!- SUBCULITAR LOCATION: Nuclear (By similarity).

C. -!- SUBCELLULAR LOCATION: Nuclear (By similarity).

C. -!- TISSUE SPECIFICITY: Expressed in heart, brain, spleen, lung, liver, muscle, kidney, uterus and gut.

C. -!- TISSUE SPECIFICITY: Contains 1 basic helix-loop-helix (bHLH) domain.

C. -!- SIMILARITY: Contains 1 brasic helix-loop-helix (bHLH) domain.

C. -!- SIMILARITY: Contains 1 orange domain.

C. -!- SIMILARITY: Contains 1 orange domain.

C. -!- SIMILARITY: Contains 1 orange domain.

       The present invention describes a basic helix loop helix (bHLH) type transcription factor designated DEC2. DEC2 can be used as a tool in the development of drugs for the treatment and prevention of disorders involving cell differentiation and proliferation. The present sequence represents the specifically claimed human DEC2a protein, as given in the present invention
                                                                                                                                                                                                                                                                                                      ;

The present invention relates to a new method for assessing whether a patient is afflicted with ovarian cancer. The method involves comparing the expression level of a marker in a control non-ovarian cancer sample, where the marker is selected from 363 cancer markers described in the specification. The method of the invention is useful in diagnosing or characterising cancer, in detecting the presence of cancer as early as possible, and the recurrence of ovarian cancer. The method may also be of particular use with patients having an enhanced risk of developing ovarian cancer (e.g. patients having a familial history of ovarian cancer). The cancer markers may be used in the management and treatment of e.g. brain and central nervous system disorders (e.g. bacterial and viral meningitis, Alzheimer's disease or Parkinson's disease), brain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                disorders (e.g. cerebral oedema, hydrocephalus or brain herniations), inflammations (e.g. bacterial or viral meningitis or encephalitis), testicular disorders (e.g. nontuberculous granulomatous orchitis), connective tissue disorders, or heart disorders (e.g. ischaemic heart disease or atherosclerosis). The compositions and methods may also be used in assessing the histological type of neoplasm associated with ovarian cancer, monitoring the progression of ovarian cancer, determini whether ovarian cancer has metastasized or is likely to metastasize, selecting a composition for inhibiting ovarian cancer, assessing the ovarian carcinogenic potential of a compound, or inhibiting ovarian cancer or at risk of developing ovarian cancer. The present amino acid sequence represents one of the ovarian cancer markers described in the

The invention describes a new isolated polypeptide (NOVX). The NOVX polypeptide, nucleic acid and antibody are useful as therapeutics, particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with NOVX polypeptide. The DNA encoding the protein is useful in gene therapy for treating the disease or condition. In particular, the NOVX polypeptide or polymucleotide is useful for treating endocrine/ metabolism-related diseases (e.g. obesity or diabetes), central nervous system disorders (e.g. Alzheimer's disease, Parkinson's disease, epilepsy, multiple sclerosis, schizophrenia or depression), autoimmune and inflammatory disorders (e.g. poscriasis, allergy, lupus erythematosus, asthma, inflammatory bowel disease, rheumatoid arthritis or osteoarthritis), cancers (e.g. colon, lung, liver, breast, ovarian, prostate or brain cancers, or melanoma), liver diseases (e.g. liver cirrhosis), lung diseases (eng. viral, bacterial or parasitic). These are also useful in developing powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications, and for monitoring the effects of drugs during clinical trials. This is the amino acid sequence of a novel human NOV protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        102

The invention relates to a novel isolated polynucleotide. The polynucleotides of the invention have cytostatic activity, and may have a use in gene therapy, and in a vaccine. The composition and methods are useful in diagnosing and/or treating cancer, particularly ovarian cancer. The composition may also be used as a vaccine to prevent cancer. The present sequence is used in the exemplification of the invention

The invention relates to 971 novel human cDNA sequences (ADC29919-ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; a method of detecting invention by against a polypeptide of the invention; and methods of invention detecting invention further dissolves methods for polypeptides of the invention; and methods of invention further dissolves methods for polypeptides of peventing, treating or amoliorating a medical condition; kits comprising polynucleotide probes and/or monoclonal antibodies for carrying out the methods of the invention methods for the identification of compounds that modulate the expression or activity of the polynucleotide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention of ADC33269 ADC33281. The nucleic acids and polypeptides of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the identification of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and in producing many other types of date and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease, Alzheimer's diseases and other neurodegemerative diseases, anaemia, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or cancer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or

The invention discloses a composition comprising two or more isolated rat or human polymucleotides or a polymucleotide which represents a fragment, or human polymucleotides or a polymucleotide which represents a fragment, a derivative or allelic variation of the nucleic acid sequence. Also calaimed are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kief to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polymorleotides, a method for producing a pharmaceutical composition, a method for identifying a compound that regulates the activity of one or more of the polympetides or their an animal of one or more of the polympetides or their antibodies. The polymucleotide or the compound that sequence its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: the sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at fig. who. int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GGGAP

The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                          AAAPFCLPFCFLSPSAAAAYVQPFLDKSGLEKYLYPAAAAAPFPLLYPGIPAPAAAAAA

The isolated protein, its encoding polynucleotide or an antibody created from the protein is useful in the manufacture of a medicament for treating a

syndrome associated with a human disease, preferably a NOVX-associated disorder, or for treating or preventing a NOVX associated disorder in a subject, preferably human. The isolated protein, its encoding polymucleotide or an antibody created from the protein are also useful for treating or preventing metabolic disorders, diabetes, obesity, infectious disease, anorexia, neurodegenerative disorder, Alzheimer's disease, and various dyslipidaemias, metabolic disturbances associated with obesity, the metabolic syndrome X, wasting disorders associated with chronic diseases, and cancer. The isolated protein are useful for chronic diseases, and cancer. The isolated protein are useful for chronic diseases, and cancer. The isolated protein are useful for creating or preventing neurological disorders such as epilepsy, stroke, mental disorders including mood, anxiety, schizophrenic disorders, diabetes disorders of vesicular transport such as cystic fibrosis, diabetes mellitus, goiter, gastrointestinal disorders including ulcerative colitis, other conditions associated with abnormal vesicle trafficking including ADDS, allergic reactions, multiple sclerosis and rheumatoid arthritis. A cell comprising the vector of the invention is useful for producing non-human transgenic animals. The polynucleotide of the invention can be used to treat disorders by gene therapy. This sequence represents one of the isolated NOVX proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      387
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   104

                                                                                                                                                                                                                                                              The invention relates to isolated nucleic acids and proteins are used encoded secreted proteins. The nucleic acids and proteins are used brevent, treat or ameliorate a medical condition in e.g. humans, micrabbits, goats, horses, cats, dogs, chickens or sheep. They are also in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosorbant (ELISA). Disorders which are diagnosed or treated include autoimmuno diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cerebral schaemia, angiogen nervous system disorders e.g. Alzheimer's disease, infections cause are disorders e.g. Alzheimer's disease, infections cause bacteria, viruses and fungi and coular disorders e.g. corneal infect and many other disorders e.g. Alzheimer's disease, infections cause to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present sequence represents a novel secreted protein of the invention. Note sequence data for this patent did not form part of the printed

The invention describes a new isolated polypeptide (NOVX). The NOVX polypeptide, nucleic acid and antibody are useful as therapeutics, polypeptide, nucleic acid and antibody are useful as therapeutics, particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with NOVX polypeptide. The DNA encoding the protein is useful in gene therapy for treating the disease or condition. In particular, the NOVX polypeptide or polynucleotide is useful for treating endocrine/ metabolism-related diseases (e.g. obesity or diabetes), central nervous system disorders (e.g. Alzheimer's disease, Parkinson's disease, epilepsy, multiple sclerosis, schizophrenia or depression), autoimmune and inflammatory disorders (e.g. psoriasis, allergy, lupus erythematosus, asthma, inflammatory bowel disease, rheumatoid arthritis or osteoarthritis), cancers (e.g. colon, lung, liver, breast, ovarian, prostate or brain cancers, or melanoma), liver diseases (e.g. liver cirrhosis), lung diseases (e.g. colon, lung, liver, breast, ovarian, prostate or brain cancers, or melanoma), liver diseases (e.g. liver cirrhosis), lung diseases (e.g. viral, bacterial or parasitic). These are also useful in developing powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications, and for monitoring the effects of drugs during clinical trials. This is the amino acid sequence of a novel human NOV protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          104

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   141
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 103
                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosorbant assays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, angiogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection, and many other disorders listed in the specification. The polypeptides can also be used to such a wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present sequence represents a novel secreted protein of the printed of the printed sequence. These patent did not form part of the printed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The

The present invention describes a basic helix loop helix (bHLH) type transcription factor designated DEC2. DEC2 can be used as a tool in the development of drugs for the treatment and prevention of disorders involving cell differentiation and proliferation. The present sequence represents the specifically claimed mouse DEC2a protein, as given in the

                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human novel polypeptides and their associated polynuclectides. The polypeptides and polynuclectides are useful in gene polynuclectides. The polypeptides and polynuclectides are useful in gene therapy for treating, inhibiting or preventing neural disorders, immune system disorders (e.g. system disorders (e.g. respiratory diseases (e.g. and multiple sclerosis), muscular disorders, respiratory diseases (e.g. and multiple sclerosis), muscular disorders, respiratory diseases (e.g. cardiovascular disorders (e.g. congenital heart defects, Ebstein's anomaly and hypoplastic left heart syndrome), renal disorders (e.g. acute kidney failure and end-stage renal disease), hyperproliferative disorders (e.g. Hodgkin's disease and leukaemia), inflammatory diseases (e.g. septic shock, bursitis and appendicitis), allergic reactions and conditions (e.g. asthma), blood related disorders (e.g. thrombosis, atherosclerosis and myocardial infarction) and cancerous diseases. Sequences ABU54914-ABU55699 and ABU55748 represent human novel polypeptides of the invention

JC7584
basic helix-loop-helix protein, DEC2 - mouse
C;Species: Mus musculus (house mouse)
C;Date: 30-Jun-2001 #sequence_revision 30-Jun-2001 #text_change
C;Accession: JC7584
R;Fujimoto, K.; Shen, M.; Noshiro, M.; Matsubara, K.; Shingu, S.
Biochem. Biophys. Res. Commun. 280, 164-171, 2001
A;Title: Molecular cloning and characterization of DEC2, a new m A;Reference number: JC7583; MUID:21092582; PMID:11162494
A;Accession: JC7584
A;Accession: JC7584
A;Accession: JC7584
A;Cross-references: UNIPROT:099PV5; DDBJ:AB044090
C;Comment: This protein, a novel member of the DEC subfamily of C;Genetics:
A;Gene: dec2
A;Map position: 6 G2-G3
C;Keywords: transcription factor
F;1-173/Region: highly conserved #status predicted
F;11-173/Region: alanine and glycine-rich #status predicted

S36748
transcription factor HES-1 - rat
N;Alternate names: hairy-like gene RHL; helix-loop-helix protein
C;Species: Rattus norvegicus (Norway rat)
C;Date: 09-Dec-1933 #sequence_revision 10-Nov-1995 #text_change 09-J
C;Accession: S36748; A48106
R;Sasai, Y; Kageyama, R.; Tagawa, Y.; Shigemoto, R.; Nakanishi, S.
Genes Dev. 6, 2620-2634, 1992

Human

```
The present invention describes a basic helix loop helix (bHLH) type transcription factor designated DEC2. DEC2 can be used as a tool in the development of drugs for the treatment and prevention of disorders involving cell differentiation and proliferation. The present sequence represents the specifically claimed human DEC2b protein, as given in the present invention
                                                                                                                                                                                                                                                                                                                          DEC family for use in of cell differentiation
                                                                                                                                                                                                       factor; DEC2; DEC1; differentiation; proliferation
                                                                                                                                                                                                                                                                                                                                                                                                                Length
                                                                                                                                                                                                                                                                                                                                                                                                                           Indels

Human; ovarian cancer; marker; cancer; familial history; brain disorder; central nervous system disorder; bacterial meningitis; Alzheimer's disease; Parkinson's disease; cerebral oedema; hydrocephalus brain herniation; inflammation; encephalitis; testicular disorder; nontuberculous granulomatous orchitis; connective tissue disorder; heart disorder; ischaemic heart disease; atherosclerosis; neoplasm; histological type; carcinogenic; ovarian cancer marker.
     The present invention describes a basic helix loop helix (bHLH) type transcription factor designated DEC2. DEC2 can be used as a tool in the development of drugs for the treatment and prevention of disorders involving cell differentiation and proliferation. The present sequence represents the specifically claimed human DEC2a protein, as given in the present invention

                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                            The present invention relates to a new method for assessing whether a patient is afflicted with ovarian cancer. The method involves comparing the expression level of a marker in a patient sample and the normal level of expression of the marker in a control non-ovarian cancer sample, where the marker is selected from 3G cancer markers described in the specification. The method of the invention is useful in diagnosing or characterising cancer, in detecting the presence of cancer as early as possible, and the recurrence of ovarian cancer. The method may also be of particular use with patients having a nenhanced risk of developing or cancer. The cancer markers may be used in the management and treatment of e.g. brain and central nervous system disorders (e.g. bacterial and viral meningitis, Alzheimer's disease or Parkinson's disease), brain disorders (e.g. bacterial or viral meningitis or encephalitis), testicular disorders (e.g. nontuberculous granulomatous orchitis), connective tissue disorders, or heart disorders (e.g. ischaemic heart disorders (e.g. nontuberculous granulomatous orchitis), cused in assessing the histological type of neoplasm associated with ovarian cancer, monitoring the progression of ovarian cancer, determining whether ovarian cancer has metastasized or is likely to metastasize, selecting a composition for inhibiting ovarian cancer, assessing the ovarian cancer as risk of developing ovarian cancer markers described in the sequence represents one of the ovarian cancer markers described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ü
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120

The invention describes a new isolated polypeptide (NOVX). The NOVX polypeptide, nucleic acid and antibody are useful as therapeutics, particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with NOVX polypeptide. The DNA encoding the protein is useful in gene therapy for treating the disease or condition. In particular, the NOVX polypeptide or polymucleotide is useful for treating endocrine/ metabolism-related diseases (e.g. obesity or diabetes), central nervous system disorders (e.g. Alzheimer's disease, Parkinson's disease, epilepsy, multiple sclerosis, schizophrenia or depression), autoimmune and inflammatory disorders (e.g. psoriasis, allergy, lupus erythematosus, asthma, inflammatory bowel disease, rheumatoid arthritis or osteoarthritis), cancers (e.g. colon, lung, liver, breast, ovarian, prostate or brain cancers, or melanoma), liver diseases (e.g. liver cirrhosis), lung diseases (emphysema or obstructive pulmonary disease), haemophilia, stroke, or infections (e.g. viral, bacterial or parasitic). These are also useful in developing powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications, and for monitoring the effects of-drugs during clinical trials. This is the amino acid sequence of a novel human NOV protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        238
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         298
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       118
                                                                                                                                                                                                                                                                                                                          The invention relates to a novel isolated polynucleotide. The polynucleotides of the invention have cytostatic activity, and may have use in gene therapy, and in a vaccine. The composition and methods are useful in diagnosing and/or treating cancer, particularly ovarian cancer. The composition may also be used as a vaccine to prevent cancer. The present sequence is used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to 971 novel human cDNA sequences (ADC29919-ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; and methods of polypucleotides or polypeptides of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The invention further discloses methods of peventing, treating or ameliorating a medical condition; kits comprising polynucleotide probes

and/or monoclonal antibodies for carrying out the methods of the invention; methods for the identification of compounds that modulate the expression or activity of the polynucleotide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention (ADC3381). The nucleic acids and polypeptides of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the identification of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease, Alzheimer's disease and other neurodegenerative diseases, anemia, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or cancer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human polypeptide sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention discloses a composition comprising two or more isolated rat or human polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also comprising the vector, a method for identifying a nagent thit to perform the method, an array, a method for identifying an agent that is differentially expressed in an animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound which regulates the expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polymetotides, a method for producing a pharmaceutical composition, a compound that regulates the activity of one or more of the polymetides given in the specification, a method for identifying a compound useful in treating continuty in an animal of one or more of the polymeptides or their antibodies. The polymoleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain and a pharmaceutical composition comprising the one or more of the sequence presented is a human protein (shown in Table 2 of the rappy). The sequence presented is a human protein (shown in Table 2 of the squence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at fip. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polypeptides of the invention.

The invention relates to an isolated polypeptide, designated NOVX, comprising a sequence fully defined in the specification. The isolated protein, its encoding polymuclectide or an antibody created from the protein is useful in the manufacture of a medicament for treating a protein, its encoding polymuclectide or an antibody created from the protein are also useful in the manufacture of a medicament for treating a subject, preferably human. The isolated protein, its encoding polymuclectide or an antibody created from the protein are also useful for treating or preventing metabolic disorders, diabetes, obesity, infectious disease, ancreavia, neurodegenerative disorder, Alzheimer's disorders, and various dyslipidaemias, metabolic disturbances associated disorders, and various dyslipidaemias, westing disorders associated with obesity, the metabolic syndrome X, wasting disorders associated with obesity, the metabolic syndrome X, wasting disorders associated with obesity, the metabolic syndrome X, wasting disorders associated with obesity, the metabolic syndrome X, wasting disorders associated with obesity, cherefully neurological disorders such as epilepsy, stroke, mental disorders including mood, anxiety, schizophrenic disorders, and soluters including mood, anxiety, schizophrenic disorders, mellitus, other conditions associated with abnormal vesicle trafficking including AIDS, allergic reactions, multiple sclerosis and rheumatoid architis, other conditions associated with abnormal vesicle trafficking including AIDS, allergic reactions, multiple sclerosis and rheumatoid architis, other conditions associated with abnormal vesicle trafficking including AIDS, allergic reactions, multiple sclerosis and rheumatoid architis, other conditions associated by the polynucleotide of the invention can be used to treat disorders by gene therapy. This sequence invention be used to treat disorders by gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120

                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a basic helix loop helix (bHLH) type transcription factor designated DEC2. DEC2 can be used as a tool in the development of drugs for the treatment and prevention of disorders involving cell differentiation and proliferation. The present sequence represents the specifically claimed mouse DEC2a protein, as given in the present invention
                                                                                                                                                                                                                                                                                                                                                                                     family for use in cell differentiation

derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain and a pharmaceutical composition comprising the segmental nerve injury (Gung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. spin the specification) which is differentially expressed during pain. Note: the sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at the wipo.int/pub/published_pot_sequence.

New cytoplasmic, nuclear membrane bound or secreted polypeptides (NOVX) and polynucleotides, useful in gene therapy, e.g. for treating or preventing obesity, multiple sclerosis, allergy, cancers, hemophilia, stroke or infections.

Claim 1; Page 126; 586pp; English.

The invention describes a new isolated polypeptide (NOVX). The NOVX polypeptide, nucleic acid and antibody are useful as therapeutics, particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with NOVX polypeptide. The DNA encoding the protein is useful in gene therapy for treating the disease or condition. In particular, the NOVX polypeptide or polynucleotide is useful for treating endocrine/ metabolism-related diseases (e.g. obesity or diabetes), central nervous system disorders (e.g. Alzheimer's disease, Parkinson's disease, epilepsy, multiple sclerosis, schizophrenia or depression), autoimmune and inflammatory disorders (e.g. psoriasis, allergy, lupus erythematosus, asthma, inflammatory bowel disease, rheumatoid arthritis or osteoarthritis), cancers (e.g. colon, lung, liver, breast, ovarian, prostate or brain cancers, or melanoma), liver diseases (e.g. liver

The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosorbant assays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. recoplasms of the breast or liver, cardiovascular disorders e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid molecules encoding 461 human secreted protein diagnosing, preventing, treating or ameliorating medical condiused as food additives or preservatives.

arrest, cerebrovascular disorders e.g. cerebral ischaemia, angiogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection, and many other disorders listed in the specification. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present sequence represents a novel secreted protein of the invention. Note: The sequence data for this patent did not form part of the printed
